

# FileRequest.execute() instructions

A FileRequest represents a request for a particular file from a web server, represented by a WebServer object. Normally, third-party clients implement their own types of requests, so it is important that the Accounts object that a Request gets access to is secure. As a test of the Accounts system, please implement FileRequest.execute() so that it does the appropriate access checks before granting access. In the process, you will need to implement User.getAuthorizedFiles(). You will find a test case already in Test.java, but please write and execute any other test cases you need to write in order to make sure that execute() works correctly.
